3 OVERVIEW

250iHP_LDOVR_01 is a low drop out voltage regulator capable to supply up to 20 mA of output current. Target output voltage can be set to one of four specified values in 2.5 - 2.7 V range.

The voltage regulator contains an error amplifier, a PMOS power transistor and resistors for setting output voltage. Error amplifier compares input reference voltage with voltage from feedback resistor divider and adjusts the impedance of the pass PMOS transistor for stabilization of output voltage at the set level. The output voltage adjustment is defined by the digital code $V_{adj}<1:0>$.

The block is fabricated on iHP SiGe BiCMOS 0.25 μm technology.
